

Practical examples

In this section TT is presenting a serie of experiences and results with the aim of showing some of the applications, benefits and possibilities that the liposome is able to provide. We have divided this section into three groups.

1. Where the results of the topically "empty liposomes" application are showed (lecitine and lipids of the stratum corneum - SC), and where the protective and regenerative effect of them may be appreciated on the stratum corneum. This effect is transferable to all cellular membranes and is part of the synergical effect of these particles in the cure and recovery of some courses and pathologies. [More...](#)

2. The results obtained using different active principles and different administration routes are showed, valuating different effects. [More...](#)

3. An industrial example is showed (wool dye). This is a very significant study because the main aim was fulfilled (ecological dye) and furthermore appeared another benefits related with it that enhance even more the results of the main aim. This is a very valid example so as to appreciate the parallel-synergical effects that are also expressed in Biology but that are hardly apreciated and valued in it. [Más...](#)
